

Global Governance Principles for the Sustainable Development of Groundwater Resources

ı

Author(s)

Conti, Kirstin Gupta, Joyeeta

Description / Abstract

A normative framework for the governance of groundwater is emerging at the global level. However, existing analyses have not comprehensively covered all the governance texts that have a bearing on transboundary groundwater resources or looked at them from the perspective of sustainable groundwater governance. Therefore, this paper responds to the questions: What are the global governance texts (including international laws) applicable to groundwater resources; to which forms of the resource do they apply; which principles have been included over time; and what are the implications for sustainable development of groundwater resources now and in the future?
