

Virtual Water: Its Implications on Agriculture and Trade

١

Author(s)

Ray, Chittaranjan McInnes, David Sanderson, Matthew

Description / Abstract

Water is the basis of life. And, unlike various forms of energy generation, water cannot simply be created where it is needed. Freshwater is remarkably scarce, comprising just 2.5% of the global water supply. Although this water at an annual level may be judged as sufficient for human use, spatio-temporal variations in the availability of freshwater over the globe is a challenge. Growing populations and rising levels of affluence mean increased competition for water, raising vital questions of equity, access, and social justice at the global scale. Water is thus a lens through which to examine an array of vital issues facing humanity and the planet: human and animal health; food production; environmental management; resource consumption; climate change adaptation and mitigation; economic development, trade and competitiveness; and ethics and consumer trust – to name but a few.
